If more than one search is submitted, please prioritize searches in order of need.

****

Please provide a detailed statement of the search topic, and describe as specifically as possible the subject matter to be searched. Include the elected species or structures, keywords, synonyms, acronyms, and registry numbers, and combine with the concept or utility of the invention. Define any terms that may have a special meaning. Give examples or relevant citations, authors, etc, if known. Please attach a copy of the cover sheet, pertinent claims, and abstract.

Title of Invention: _____

Inventors (please provide full names): _____

PT    DNA encoding melanoma antigens recognised by T-lymphocytes - also
PT    vectors, host cells and antibodies, used to detect, treat and
PT    immunise animal against melanoma.
PS    Claim 11; Page 117; 184pp; English.
CC    The melanoma antigen (MART-1) is produced by recombinant DNA
CC    methods, i.e. preferably using a baculovirus vector for expression
CC    in insect cell cultures.  MART-1 protein is a source of immunogenic
CC    peptides (see R84196 for peptide M9-2) which are optionally modified
CC    (see R84783-R84800) and used in medicaments for the treatment or
CC    prevention (by immunization) of melanoma.  Antibodies against MART-1
CC    and its immunogenic peptides may be used in the detection and
CC    isolation of MART-1 from a sample, the detection of which is
CC    indicative of a disease state (melanoma or metastatic melanoma).

PT    Nucleic acid coding for a tumour rejection antigen precursor - is
PT    used for developing prods. for diagnosis or treatment of expression
PT    related disorders, partic. melanoma
PS    Claim 5; Page 14; 26pp; English.
CC    This sequence represents the tumour rejection antigen precursor which is
CC    processed to a tumour rejection antigen presented by HLA-A2 molecules.
CC    The tumour rejection antigen is not related to tyrosinase.  The cDNA
CC    encoding this sequence was isolated from the melanoma cell line,
CC    LB-39-MEL.  The tumour rejection antigen may be used for diagnosis or
CC    in vaccines or for therapy of disorders characterised by the expression
CC    of the tumour rejection antigen precursor, particularly melanoma.

PT    Adeno-associated virus:liposome complexes for transfecting dendritic
PT    cells - for inducing immune response, useful for treating e.g.
PT    neoplasia or infections
PS    Example 5; Page 58; 134pp; English.
CC    Tumour associated antigens (W13660-61, W00878-903) can be loaded
CC    into dendritic cells and used to induce antitumour immunity.
CC    Alternatively, the dendritic cells are transfected with adeno
CC    associated virus plasmid DNA (which includes DNA encoding the
CC    tumour associated antigen) complexed with cationic liposomes.  The
CC    amtigen loaded or transfected dendritic cells can be used to
CC    generate tumour antigen-specific cytotoxic T lymphocytes for use in
CC    adoptive immunotherapy in a patient having the corresponding
CC    tumour.  A suitable antigen comprises amino acids 27-47 (W00903)
CC    of human melanoma MART-1/Aa.

PT Use of a tumour rejection antigen precursor - as a marker for
PT diagnosing a disorder characterised by expression of a tumour
PT rejection antigen precursor which is not tyrosinase
PS Claim 1; Column 7-9; 11pp; English.
CC A method has been developed for the diagnosis of a disorder which is
CC characterised by the expression of a tumour rejection antigen precursor
CC (TRAP) which is not tyrosinase, and which is processed to a TRA which
CC forms a complex with an HLA-A2 molecule. The present sequence represents
CC the TRAP for use in the present invention. The method comprises
CC contacting a sample from a subject with an agent specific for the
CC complex and determining the interaction between the complex and the
CC agent as a determination of the disorder. TRAP can be used for the
CC diagnosis and treatment of disorders characterised by the expression
CC of the TRAP molecules such as cancers, particularly melanoma.

PT Isolated peptides that bind to human leucocyte antigen class II
PT molecules
PS Disclosure; Page 29; 88pp; English.
CC The present sequence represents an exemplary tumour associated peptide
CC antigen. The specification describes a MAGE-3 tumour associated gene.
CC Peptides (Y01721-25) that bind human leucocyte antigen (HLA) Class II
CC molecules can be derived from the MAGE-3 protein. These peptides and
CC autologous CD4+ cells that bind to a complex of MAGE-3 peptide
CC and HLA Class II, are used to treat MAGE-3 related diseases,
CC particularly cancers (e.g. melanoma, osteosarcoma, leukemia and
CC various forms of carcinoma). The peptides are also used to produce
CC specific antibodies. Detection of of the peptides, e.g. in binding
CC assays, particularly with antibodies, is used for diagnosis of such
CC diseases.

PT Immunization methods using viruses expressing antigen for priming
PT and booster immunizations - useful for modulating immune responses
PT against antigen, e.g. enhancing immune response against tumour cells
PT expressing tumour rejection antigens
PS Disclosure; Page 10; 33pp; English.
CC This sequence represents a tumour antigen booster peptide that can be
CC used in the method of the invention. The method is for for modulating an
CC immune response in a mammal against an antigen, and comprises:
CC (A) inducing an immune response by: (i) administering a virus containing
CC a nucleic acid molecule encoding the antigen or its precursor to generate
CC an immune response; and (ii) administering at least one booster dose
CC comprising a peptide including the antigen, in an adjuvant, in a combined
CC amount effective to enhance the initial immune response; or
CC (B) reducing an immune response as defined for (A) but using a
CC non-adjuvant with the peptide which includes the antigen, in an amount
CC effective to reduce the initial immune response. Method (A) is used to
CC enhance the immune response against tumour cells expressing tumour
CC rejection antigens, and against pathogens in subjects having human
CC leukocyte antigen-presenting molecules. Method (B) is used to reduce the
CC immune response in allergy, autoimmune disease, and allograft rejection.
CC Method (A) provides an immunisation method which, unlike prior art, is
CC not limited by the host immune response against viral vectors.

PT Inducing a cytotoxic T lymphocyte response - by maintaining a level
PT of antigen in the lymphatic system of a mammal so as to provide a
PT sustained CTL response, used to treat, e.g. AIDS
PS Disclosure; Page 47; 199pp; English.
CC The present invention describes a method of inducing and/or sustaining
CC an immunological cytotoxic T lymphocyte (CTL) response in a mammal. The
CC method comprises: (a) delivering an antigen to the mammal at a level to
CC induce an immunological CTL response in the mammal; and (b) maintaining
CC the level of the antigen in the mammal's lymphatic system to maintain
CC the immunologic CTL response. The method can be used for the delivery of
CC e.g. a differentiation antigen, a tumour-specific multilineage antigen,
CC an embryonic antigen, an oncogene antigen, a mutated tumour-suppressor
CC gene antigen, or a viral antigen. They can be used for the treatment of
CC disease such as cancer, e.g. malignant melanoma or infectious disease,
CC e.g. viral disease such as hepatitis or AIDS. Sustained antigen delivery
CC to the lymphatic system provides for potent CTL stimulation that takes
CC place in the milieu of the lymphoid organ, and it sustains stimulation
CC that is necessary to keep CTL active, cytotoxic and recirculating
CC through the body. Y10071 to Y10639 represent examples of peptide
CC antigens given in the present invention.

PT   New decamer peptides which bind to HLA molecules - useful to
PT   identify HLA-A2 positive cells and provoke T cells
PS   Claim 17; Page 9; 45pp; English.
CC   The present invention describes peptides which bind to an HLA-A2
CC   molecule and have Val at the carboxy terminus, and either: (a) Ala, Tyr
CC   or Phe at the amino terminus, and Ala at position 2 (P1); or (b) Glu at
CC   the amino terminus, and Ala, Leu, or Met at positions 2 and 3, with the
CC   proviso that Ala is not at both positions (P2). The present sequence
CC   represents an HLA-A2 binding peptide. The peptides of the present
CC   invention are used to identify HLA-A2 positive cells, provoke T cells,
CC   and determine the presence of particular T cells including cytolytic
CC   T cells (CTLs). They provide a better target than the prior art
CC   CTL-stimulating peptide.

PT   Method of selecting T cell peptide epitope(s) - by measuring the
PT   stability of HLA class I-peptide complexes on intact B cells
PS   Disclosure; Page 6; 109pp; English.
CC   Peptides W39430-W39734 are used in a novel method for the selection of
CC   immunogenic T-cell peptide epitopes present in polypeptide antigens.
CC   Peptides W39430 and W39431 are derived from MART-1. The method involves
CC   the identification of peptide sequences capable of binding to an HLA
CC   (human leukocyte antigen) class I molecule and measuring the binding of
CC   this epitope peptide to the HLA class I peptide. The stability of binding
CC   of the peptide and MHC (major histocompatablilty complex) class I
CC   molecule is measured on intact human B cells carrying the MHC molecule at
CC   their cell surfaces. The method can be used to select peptide epitopes
CC   for generating vaccines against a disease associated with the
CC   polypeptide, e.g. cancers or AIDS. The peptide epitopes are especially
CC   T-cell peptide epitopes with strong anti-tumour and anti-viral immune
CC   responses.

PT T cell receptor alpha and/or beta chains, and related nucleic acids
PT useful in pharmaceutical compsns. to prevent or treat cancer,
PT partic. lung, melanoma, ovarian, colon, brain or kidney tumours
PS Example 3; Page 11; 125pp; English
CC W07378-W07381 are MART-1 epitopes, M9-1, M9-2, M10-3 and M10-4
CC respectively, that are recognised by melanoma specific T lymphocyte
CC receptors (TCRs). Melanoma-specific TCRs comprising an alpha and
CC beta chain were made. Nucleic acids from either of these chains can be
CC used as probes for the detection of expression of rearranged genes
CC encoding tumour-associated antigens. The nucleic acids may also be used
CC to create transgenic animals, useful as biological models to study cancer
CC and evaluate diagnostic and therapeutic methods for the treatment of
CC cancers, particularly melanomas. Antibodies (Abs) may be raised against
CC alpha and beta chain polypeptides and used to detect native or denatured
CC TCRs and/or alterations in expression levels of T cells carrying
CC melanoma-specific TCRs. Abs can also purify and enrich T cells carrying
CC the above receptors, which can then be administered therapeutically to
CC mammals. Anti-idiotype antibodies can be used to assess the level of a
CC specific T cell carrying these receptors in a mammal being treated using
CC these methods. Host cells and vectors carrying nucleic acid encoding
CC a TCR (or individual alpha or beta chain fragment) are useful in
CC pharmaceutical compositions to prevent or treat cancer in a mammal, e.g.
CC lung, melanoma, ovarian, colon, brain or kidney tumours.

PT Melanoma associated peptide analogues - useful in vaccines against
PT melanoma
PS Example 1; Page 28; 47pp; English.
CC This sequence is shown in the specification. The invention relates to
CC peptides, which are immunogenic with lymphocytes directed against
CC metastatic melanomas. They are characterised in that they comprise at
CC least a part of the following sequence, where the amino acid at position
CC 2 or 8 is substituted: Lys-Thr-Trp-Gly-Gln-Tyr-Trp-Gln-Val. Vaccines
CC comprising the peptide, an epitope of the peptide, nucleotide sequence
CC encoding the peptide, or an antigen presenting cell preloaded with the
CC peptide or antibody as above, are useful for cancer, particularly
CC melanoma, treatment. The peptides can also be used to generate antigen
CC reactive tumour infiltrating lymphocytes, which can also be used in
CC vaccines. The peptides can be exploited to elicit native epitope-reactive
CC CTL. Usage of the peptides with improved immunogenicity may contribute
CC to the development of CTL-epitope based vaccines in viral disease and
CC cancer.

PT Non-dendritic peptide carrier linked to a solid phase - useful as a
PT diagnostic agent and as a scaffold for production of chemical
PT derivatives
PS Example 26; Page 146; 262pp; English.
CC A non-dendritic peptide carrier (A) has been developed which is coupled
CC through a linker to a solid phase, forming a complex of (A)-solid phase.
CC Where (A) comprises 10-50 amino acids capable of forming a secondary
CC structure in a benign buffer after liberation from the solid phase, and

```
CC   further the (A)-solid phase complex comprises an immunogenic substance
CC   and/or an immune mediator coupled on (A). The present sequence
CC   represents a peptide used in an example from the present invention. An
CC   (A)-solid phase complex can be used as a scaffold for the production of
CC   chemical derivatives, characterised by covalently attaching molecules at
CC   attachment points. Alternatively (A) is used as a scaffold-peptide for
CC   the incorporation into an Immunostimulating Complex (Iscom) resulting an
CC   (A)-Iscom complex which is used for the chemical coupling of antigenic
CC   substances in an aqueous solution by conjugation. (A) derivatised with
CC   one or more peptides having fibronectin-, laminin- or vitronectin-like
CC   binding activities can be used for the promotion of cell-attachment to
CC   plastic surfaces, in particular to inhibit tumour growth and metastasis,
CC   and for promotion of wound healing. Also a derivatised (A) can be used
CC   for the selection of specifically-binding aptamers or as a diagnostic
CC   agent. Such diagnostic-(A) molecules could be used to detect molecules
CC   derived from or indicative of pregnancy or of a disease, such as an
CC   infectious, autoimmune or cancerous disease.

PT   Increasing uptake and presentation of antigen(s) - by adding mannose
PT   residue(s) to antigen for increasing T cell response, useful in,
PT   e.g. vaccines against viral infection(s)
PS   Disclosure; Page 24; 47pp; English.
CC   The peptides W54559-W54809 are examples of peptides to which at least 1
CC   (preferably 2) mannose can be attached to increase their uptake as
CC   antigens by antigen-presenting cells.  Uptake of agonist mannosylated
CC   peptides will increase the T cell response, whereas uptake of antagonist
CC   peptides blocks the T cell response.  Blocking binding of immunogenic
CC   autoantigens can be used in treatment of type I diabetes, rheumatoid
CC   arthritis, graft rejection etc., also to induce T-cell non-
CC   responsiveness.  Vaccines containing mannosylated antigen are used to
CC   prevent or treat infections by, e.g. bacteria, viruses, fungi, helminths
CC   and parasites.

PT   Detection, purification and elimination of antigen-specific
PT   lymphocytes - for producing cytotoxic T cells for immuno-therapy of
PT   cancers and viral infection
PS   Disclosure; Page 30; 222pp; French.
CC   Peptides W68301-W68384 are examples of antigens (Ag) which can be loaded
CC   onto recombinantly produced major histocompatibility complex (MHC)
CC   molecules in a method of detecting antigen-specific lymphocytes.  The
CC   MHC-antigen complex is then immobilised on a solid support and a sample
CC   containing cells recognising the MHC-Ag complex may be isolated.  This
CC   peptide is derived from the human MART1/MELAN-A protein and binds the
CC   human leukocyte antigen A2 (HLA-A2). A similar method is used to isolate,
CC   purify or eliminate Ag-specific T-cells or to produce Ag-specific
CC   cytotoxic T-cells (CTC).  The method is also used to detect and quantify
CC   tumour-specific T-cells and to generate CTC for specific killing of
CC   tumour cells (solid tumours, leukaemia or lymphoma) by injection into
CC   a human or animal, but also for treating viral infections.

PT   Isolated peptides that bind to human leucocyte antigen class II
PT   molecules
PS   Disclosure; Page 29; 88pp; English.
CC   The present sequence represents an exemplary tumour associated peptide
CC   antigen. The specification describes a MAGE-3 tumour associated gene.
CC   Peptides (Y01721-25) that bind human leucocyte antigen (HLA) Class II
CC   molecules can be derived from the MAGE-3 protein. These peptides and
CC   autologous CD4+ cells that bind to a complex of MAGE-3 peptide
CC   and HLA Class II, are used to treat MAGE-3 related diseases,
CC   particularly cancers (e.g. melanoma, osteosarcoma, leukemia and
CC   various forms of carcinoma). The peptides are also used to produce
CC   specific antibodies. Detection of of the peptides, e.g. in binding
CC   assays, particularly with antibodies, is used for diagnosis of such
CC   diseases.

PT New decamer peptides which bind to HLA molecules - useful to
PT identify HLA-A2 positive cells and provoke T cells
PS Claim 18; Page 6; 45pp; English.
CC The present invention describes peptides which bind to an HLA-A2
CC molecule and have Val at the carboxy terminus, and either: (a) Ala, Tyr
CC or Phe at the amino terminus, and Ala at position 2 (P1); or (b) Glu at
CC the amino terminus, and Ala, Leu, or Met at positions 2 and 3, with the
CC proviso that Ala is not at both positions (P2). The present sequence
CC represents an HLA-A2 binding peptide. The peptides of the present
CC invention are used to identify HLA-A2 positive cells, provoke T cells,
CC and determine the presence of particular T cells including cytolytic
CC T cells (CTLs). They provide a better target than the prior art
CC CTL-stimulating peptide.

PT Immunization methods using viruses expressing antigen for priming
PT and booster immunizations - useful for modulating immune responses
PT against antigen, e.g. enhancing immune response against tumour cells
PT expressing tumour rejection antigens
PS Disclosure; Page 10; 33pp; English.
CC This sequence represents a tumour antigen booster peptide that can be
CC used in the method of the invention. The method is for for modulating an
CC immune response in a mammal against an antigen, and comprises:
CC (A) inducing an immune response by: (i) administering a virus containing
CC a nucleic acid molecule encoding the antigen or its precursor to generate
CC an immune response; and (ii) administering at least one booster dose
CC comprising a peptide including the antigen, in an adjuvant, in a combined
CC amount effective to enhance the initial immune response; or
CC (B) reducing an immune response as defined for (A) but using a
CC non-adjuvant with the peptide which includes the antigen, in an amount
CC effective to reduce the initial immune response. Method (A) is used to
CC enhance the immune response against tumour cells expressing tumour
CC rejection antigens, and against pathogens in subjects having human
CC leukocyte antigen-presenting molecules. Method (B) is used to reduce the
CC immune response in allergy, autoimmune disease, and allograft rejection.
CC Method (A) provides an immunisation method which, unlike prior art, is
CC not limited by the host immune response against viral vectors.

PT Method of selecting T cell peptide epitope(s) - by measuring the
PT stability of HLA class I-peptide complexes on intact B cells
PS Example 3; Page 29; 109pp; English.
CC Peptides W39430-W39734 are used in a novel method for the selection of
CC immunogenic T-cell peptide epitopes present in polypeptide antigens. The
CC method involves the identification of peptide sequences capable of
CC binding to an HLA (human leukocyte antigen) class I molecule and
CC measuring the binding of this epitope peptide to the HLA class I peptide.
CC The stability of binding of the peptide and MHC (major histocompatablilty
CC complex) class I molecule is measured on intact human B cells carrying
CC the MHC molecule at their cell surfaces. The method can be used to select
CC peptide epitopes for generating vaccines against a disease associated
CC with the polypeptide, e.g. cancers or AIDS. The peptide epitopes are
CC especially T-cell peptide epitopes with strong anti-tumour and anti-viral
CC immune responses. Peptide W39447 is an immunodominant peptide-epitope
CC presented by HLA-A*0201-positive melanoma cells and displays considerable
CC binding to HLA-A*0201 in assays.

PT T cell receptor alpha and/or beta chains, and related nucleic acids
PT - useful in pharmaceutical compsns. to prevent or treat cancer,
PT partic. lung, melanoma, ovarian, colon, brain or kidney tumours
PS Example 3; Page 11; 125pp; English
CC W07378-W07381 are MART-1 epitopes, M9-1, M9-2, M10-3 and M10-4
CC respectively, that are recognised by melanoma specific T lymphocyte
CC receptors (TCRs). Melanoma-specific TCRs comprising an alpha and
CC beta chain were made. Nucleic acids from either of these chains can be
CC used as probes for the detection of expression of rearranged genes
CC encoding tumour-associated antigens. The nucleic acids may also be used
CC to create transgenic animals, useful as biological models to study cancer
CC and evaluate diagnostic and therapeutic methods for the treatment of
CC cancers, particularly melanomas. Antibodies (Abs) may be raised against
CC alpha and beta chain polypeptides and used to detect native or denatured
CC TCRs and/or alterations in expression levels of T cells carrying
CC melanoma-specific TCRs. Abs can also purify and enrich T cells carrying
CC the above receptors, which can then be administered therapeutically to
CC mammals. Anti-idiotype antibodies can be used to assess the level of a
CC specific T cell carrying these receptors in a mammal being treated using
CC these methods. Host cells and vectors carrying nucleic acid encoding
CC a TCR (or individual alpha or beta chain fragment) are useful in
CC pharmaceutical compositions to prevent or treat cancer in a mammal, e.g.
CC lung, melanoma, ovarian, colon, brain or kidney tumours.

PT Composition containing immunogen and granulocyte macrophage colony
PT stimulating factor as adjuvant - particularly for generating a
PT cytotoxic T cell response to tumour antigens or their precursors
PS Claim 7; Page 12; 37pp; English.
CC This sequence represents a specifically claimed example of a tumour
CC rejection antigen (TRA) which was used with granulocyte macrophage
CC colony-stimulating factor (GM-CSF) as adjuvant to generate an immune,
CC specifically cytolytic T cell (CTL), response for treatment of cancers
CC or where cell transformation has occurred, e.g. in melanoma or dysplastic
CC nevi. These tumour rejection antigens can also be used diagnostically (if
CC they can induce CTL or antibodies specific for the antigens then this
CC indicates presence of the antigen in the patient). GM-CSF provokes, or
CC increases, immune response to the tumour rejection antigens.

PT Increasing uptake and presentation of antigen(s) - by adding mannose
PT residue(s) to antigen for increasing T cell response, useful in,
PT e.g. vaccines against viral infection(s)
PS Disclosure; Page 25; 47pp; English.
CC The peptides W54559-W54809 are examples of peptides to which at least 1
CC (preferably 2) mannose can be attached to increase their uptake as
CC antigens by antigen-presenting cells. Uptake of agonist mannosylated
CC peptides will increase the T cell response, whereas uptake of antagonist
CC peptides blocks the T cell response. Blocking binding of immunogenic
CC autoantigens can be used in treatment of type I diabetes, rheumatoid
CC arthritis, graft rejection etc., also to induce T-cell non-
CC responsiveness. Vaccines containing mannosylated antigen are used to
CC prevent or treat infections by, e.g. bacteria, viruses, fungi, helminths
CC and parasites.

PT Introducing therapeutic proteins, especially antigens, into cells -
PT using toxin molecules and/or polycationic handles for delivery
PS Claim 15; Page 37; 67pp; English.
CC This is the antigenic MART-1 peptide M10-3. This antigenic compound
CC can be introduced into the cytoplasm of a cell by a new method where
CC the cell is contacted with a fusion molecule comprising a delivery
CC molecule. The delivery molecule can either be a polycationic affinity
CC handle, LFN (the protective antigen binding domain of anthrax lethal
CC factor) or a toxin delivery molecule related to LFN. The antigenic

```
CC  compound is linked to either of the delivery molecules by a covalent
CC  bond. The B moiety of a toxin enhances delivery of the antigenic compound
CC  into a cell. The anthrax toxin system of the invention eliminates the
CC  need to generate fusion proteins with a toxin B moiety, which alleviates
CC  problems associated with incorrect folding of lengthy fusion proteins.
CC  Small cationic fusion peptides substituted for LFN may reduce the
CC  possibility of steric interference with the biological activity of the
CC  translocated protein. The method is used for the introduction of
CC  antigens, e.g. MHC class I antigens or any other therapeutic protein,
CC  e.g. toxin molecules, apoptosis-inducing molecules or signalling
CC  proteins into the cells.

PT  DNA encoding melanoma antigens recognised by T-lymphocytes - also
PT  vectors, host cells and antibodies, used to detect, treat and
PT  immunise animal against melanoma.
PS  Claim 11; Page 117; 184pp; English.
CC  The melanoma antigen (MART-1) is produced by recombinant DNA
CC  methods, i.e. preferably using a baculovirus vector for expression
CC  in insect cell cultures.  MART-1 protein is a source of immunogenic
CC  peptides (see R84196 for peptide M9-2) which are optionally modified
CC  (see R84783-R84800) and used in medicaments for the treatment or
CC  prevention (by immunization) of melanoma.  Antibodies against MART-1
CC  and its immunogenic peptides may be used in the detection and
CC  isolation of MART-1 from a sample, the detection of which is
CC  indicative of a disease state (melanoma or metastatic melanoma).

PT  Nucleic acid coding for a tumour rejection antigen precursor - is
PT  used for developing prods. for diagnosis or treatment of expression
PT  related disorders, partic. melanoma
PS  Claim 5; Page 14; 26pp; English.
CC  This sequence represents the tumour rejection antigen precursor which is
CC  processed to a tumour rejection antigen presented by HLA-A2 molecules.
CC  The tumour rejection antigen is not related to tyrosinase.  The cDNA
CC  encoding this sequence was isolated from the melanoma cell line,
CC  LB-39-MEL.  The tumour rejection antigen may be used for diagnosis or
CC  in vaccines or for therapy of disorders characterised by the expression
CC  of the tumour rejection antigen precursor, particularly melanoma.

PT   Use of a tumour rejection antigen precursor - as a marker for
PT   diagnosing a disorder characterised by expression of a tumour
PT   rejection antigen precursor which is not tyrosinase
PS   Claim 1; Column 7-9; 11pp; English.
CC   A method has been developed for the diagnosis of a disorder which is
CC   characterised by the expression of a tumour rejection antigen precursor
CC   (TRAP) which is not tyrosinase, and which is processed to a TRA which
CC   forms a complex with an HLA-A2 molecule. The present sequence represents
CC   the TRAP for use in the present invention. The method comprises
CC   contacting a sample from a subject with an agent specific for the
CC   complex and determining the interaction between the complex and the
CC   agent as a determination of the disorder. TRAP can be used for the
CC   diagnosis and treatment of disorders characterised by the expression
CC   of the TRAP molecules such as cancers, particularly melanoma.

PT   New decamer peptides which bind to HLA molecules - useful to
PT   identify HLA-A2 positive cells and provoke T cells
PS   Claim 13; Page 21; 45pp; English.
CC   The present invention describes peptides which bind to an HLA-A2
CC   molecule and have Val at the carboxy terminus, and either: (a) Ala, Tyr
CC   or Phe at the amino terminus, and Ala at position 2 (P1); or (b) Glu at
CC   the amino terminus, and Ala, Leu, or Met at positions 2 and 3, with the
CC   proviso that Ala is not at both positions (P2). The present sequence
CC   represents an HLA-A2 binding peptide. The peptides of the present
CC   invention are used to identify HLA-A2 positive cells, provoke T cells,
CC   and determine the presence of particular T cells including cytolytic
CC   T cells (CTLs). They provide a better target than the prior art
CC   CTL-stimulating peptide.

PT   Inducing a cytotoxic T lymphocyte response - by maintaining a level
PT   of antigen in the lymphatic system of a mammal so as to provide a
PT   sustained CTL response, used to treat, e.g. AIDS
PS   Disclosure; Page 47; 199pp; English.
CC   The present invention describes a method of inducing and/or sustaining
CC   an immunological cytotoxic T lymphocyte (CTL) response in a mammal. The
CC   method comprises: (a) delivering an antigen to the mammal at a level to
CC   induce an immunological CTL response in the mammal; and (b) maintaining
CC   the level of the antigen in the mammal's lymphatic system to maintain
CC   the immunologic CTL response. The method can be used for the delivery of
CC   e.g. a differentiation antigen, a tumour-specific multilineage antigen,
CC   an embryonic antigen, an oncogene antigen, a mutated tumour-suppressor
CC   gene antigen, or a viral antigen. They can be used for the treatment of
CC   disease such as cancer, e.g. malignant melanoma or infectious disease,
CC   e.g. viral disease such as hepatitis or AIDS. Sustained antigen delivery
CC   to the lymphatic system provides for potent CTL stimulation that takes
CC   place in the milieu of the lymphoid organ, and it sustains stimulation
CC   that is necessary to keep CTL active, cytotoxic and recirculating
CC   through the body. Y10071 to Y10639 represent examples of peptide
CC   antigens given in the present invention.

PT Immunization methods using viruses expressing antigen for priming
PT and booster immunizations - useful for modulating immune responses
PT against antigen, e.g. enhancing immune response against tumour cells
PT expressing tumour rejection antigens
PS Disclosure; Page 10; 33pp; English.
CC This sequence represents a tumour antigen booster peptide that can be
CC used in the method of the invention. The method is for for modulating an
CC immune response in a mammal against an antigen, and comprises:
CC (A) inducing an immune response by: (i) administering a virus containing
CC a nucleic acid molecule encoding the antigen or its precursor to generate
CC an immune response; and (ii) administering at least one booster dose
CC comprising a peptide including the antigen, in an adjuvant, in a combined
CC amount effective to enhance the initial immune response; or
CC (B) reducing an immune response as defined for (A) but using a
CC non-adjuvant with the peptide which includes the antigen, in an amount
CC effective to reduce the initial immune response. Method (A) is used to
CC enhance the immune response against tumour cells expressing tumour
CC rejection antigens, and against pathogens in subjects having human
CC leukocyte antigen-presenting molecules. Method (B) is used to reduce the
CC immune response in allergy, autoimmune disease, and allograft rejection.
CC Method (A) provides an immunisation method which, unlike prior art, is
CC not limited by the host immune response against viral vectors.

COMMENT     This is a component of the enzyme complex that catalyzes 2,
              6-dichlorophenolindophenol-dependent cleavage of acetoin into
              acetate and acetaldehyde. The functional enzyme is a tetramer of
              two alpha and two beta chains.
CLASSIFICATION    #superfamily pyruvate dehydrogenase (lipoamide) alpha chain;
                    thiamine pyrophosphate-binding domain homology

COMMENT     Gene D protein is a major component of the phage head and serves to
              stabilize the head during DNA packaging. There are approximately
              420 copies of protein D per mature phage.

MPsrch_pp protein - protein database search, using Smith-Waterman algorithm

Run on: Fri May 5 22:17:41 2000; MasPar time 3.08 Seconds
96.985 Million cell updates/sec

Tabular output not generated.

Title: >US-09-267-439-18
Description: (1-10) from US09267439.pep
Perfect Score: 63
Sequence: 1 AAGIGILTVI 10

Scoring table: PAM 150
Gap 15

Searched: 82229 seqs, 29864866 residues

Post-processing: Minimum Match 0%
Listing first 45 summaries

Database: swiss-prot38
1:swissprot

Statistics: Mean 23.818; Variance 26.551; scale 0.897

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

PT New decamer peptides which bind to HLA molecules - useful to
PT identify HLA-A2 positive cells and provoke T cells
PS Claim 13; Page 9; 45pp; English.
CC The present invention describes peptides which bind to an HLA-A2
CC molecule and have Val at the carboxy terminus, and either: (a) Ala, Tyr
CC or Phe at the amino terminus, and Ala at position 2 (P1); or (b) Glu at
CC the amino terminus, and Ala, Leu, or Met at positions 2 and 3, with the
CC proviso that Ala is not at both positions (P2). The present sequence
CC represents an HLA-A2 binding peptide. The peptides of the present
CC invention are used to identify HLA-A2 positive cells, provoke T cells,
CC and determine the presence of particular T cells including cytolytic
CC T cells (CTLs). They provide a better target than the prior art
CC CTL-stimulating peptide.

PT DNA encoding melanoma antigens recognised by T-lymphocytes - also
PT vectors, host cells and antibodies, used to detect, treat and
PT immunise animal against melanoma.
PS Claim 12; Page 122; 184pp; English.
CC Immunogenic peptide M10-4 is a derivative of peptide M9-2 (R84196)
CC which is based on the melanoma antigen (MART-1) (see R84212).
CC M9-2 may be modified to improve immunogenicity (see R84783-R84800)
CC and used in medicaments for the treatment or prevention (by
CC immunization) of melanoma. Antibodies against MART-1 and its
CC immunogenic peptides may be used in the detection and isolation of
CC MART-1 from a sample, the detection of which is indicative of a
CC disease state (melanoma or metastatic melanoma).

PT T cell receptor alpha and/or beta chains, and related nucleic acids
PT - useful in pharmaceutical compsns. to prevent or treat cancer,
PT partic. lung, melanoma, ovarian, colon, brain or kidney tumours
PS Example 3; Page 11; 125pp; English
CC W07378-W07381 are MART-1 epitopes, M9-1, M9-2, M10-3 and M10-4
CC respectively, that are recognised by melanoma specific T lymphocyte
CC receptors (TCRs). Melanoma-specific TCRs comprising an alpha and
CC beta chain were made. Nucleic acids from either of these chains can be
CC used as probes for the detection of expression of rearranged genes
CC encoding tumour-associated antigens. The nucleic acids may also be used
CC to create transgenic animals, useful as biological models to study cancer
CC and evaluate diagnostic and therapeutic methods for the treatment of
CC cancers, particularly melanomas. Antibodies (Abs) may be raised against
CC alpha and beta chain polypeptides and used to detect native or denatured
CC TCRs and/or alterations in expression levels of T cells carrying
CC melanoma-specific TCRs. Abs can also purify and enrich T cells carrying
CC the above receptors, which can then be administered therapeutically to
CC mammals. Anti-idiotype antibodies can be used to assess the level of a
CC specific T cell carrying these receptors in a mammal being treated using
CC these methods. Host cells and vectors carrying nucleic acid encoding
CC a TCR (or individual alpha or beta chain fragment) are useful in
CC pharmaceutical compositions to prevent or treat cancer in a mammal, e.g.
CC lung, melanoma, ovarian, colon, brain or kidney tumours.

PT   Use of a tumour rejection antigen precursor - as a marker for
PT   diagnosing a disorder characterised by expression of a tumour
PT   rejection antigen precursor which is not tyrosinase
PS   Claim 1; Column 7-9; 11pp; English.
CC   A method has been developed for the diagnosis of a disorder which is
CC   characterised by the expression of a tumour rejection antigen precursor
CC   (TRAP) which is not tyrosinase, and which is processed to a TRA which
CC   forms a complex with an HLA-A2 molecule. The present sequence represents
CC   the TRAP for use in the present invention. The method comprises
CC   contacting a sample from a subject with an agent specific for the
CC   complex and determining the interaction between the complex and the
CC   agent as a determination of the disorder. TRAP can be used for the
CC   diagnosis and treatment of disorders characterised by the expression
CC   of the TRAP molecules such as cancers, particularly melanoma.

PT   Nucleic acid coding for a tumour rejection antigen precursor - is
PT   used for developing prods. for diagnosis or treatment of expression
PT   related disorders, partic. melanoma
PS   Claim 5; Page 14; 26pp; English.
CC   This sequence represents the tumour rejection antigen precursor which is
CC   processed to a tumour rejection antigen presented by HLA-A2 molecules.
CC   The tumour rejection antigen is not related to tyrosinase.  The cDNA
CC   encoding this sequence was isolated from the melanoma cell line,
CC   LB-39-MEL.  The tumour rejection antigen may be used for diagnosis or
CC   in vaccines or for therapy of disorders characterised by the expression
CC   of the tumour rejection antigen precursor, particularly melanoma.

PT   DNA encoding melanoma antigens recognised by T-lymphocytes - also
PT   vectors, host cells and antibodies, used to detect, treat and
PT   immunise animal against melanoma.
PS   Claim 11; Page 117; 184pp; English.
CC   The melanoma antigen (MART-1) is produced by recombinant DNA
CC   methods, i.e. preferably using a baculovirus vector for expression
CC   in insect cell cultures.  MART-1 protein is a source of immunogenic
CC   peptides (see R84196 for peptide M9-2) which are optionally modified
CC   (see R84783-R84800) and used in medicaments for the treatment or
CC   prevention (by immunization) of melanoma.  Antibodies against MART-1
CC   and its immunogenic peptides may be used in the detection and
CC   isolation of MART-1 from a sample, the detection of which is
CC   indicative of a disease state (melanoma or metastatic melanoma).

PT   Isolated peptides that bind to human leucocyte antigen class II
PT   molecules
PS   Disclosure; Page 29; 88pp; English.
CC   The present sequence represents an exemplary tumour associated peptide
CC   antigen. The specification describes a MAGE-3 tumour associated gene.
CC   Peptides (Y01721-25) that bind human leucocyte antigen (HLA) Class II
CC   molecules can be derived from the MAGE-3 protein. These peptides and
CC   autologous CD4+ cells that bind to a complex of MAGE-3 peptide
CC   and HLA Class II, are used to treat MAGE-3 related diseases,
CC   particularly cancers (e.g. melanoma, osteosarcoma, leukemia and
CC   various forms of carcinoma). The peptides are also used to produce
```

```
CC   specific antibodies. Detection of of the peptides, e.g. in binding
CC   assays, particularly with antibodies, is used for diagnosis of such
CC   diseases.

PT   Immunization methods using viruses expressing antigen for priming
PT   and booster immunizations - useful for modulating immune responses
PT   against antigen, e.g. enhancing immune response against tumour cells
PT   expressing tumour rejection antigens
PS   Disclosure; Page 10; 33pp; English.
CC   This sequence represents a tumour antigen booster peptide that can be
CC   used in the method of the invention. The method is for for modulating an
CC   immune response in a mammal against an antigen, and comprises:
CC   (A) inducing an immune response by: (i) administering a virus containing
CC   a nucleic acid molecule encoding the antigen or its precursor to generate
CC   an immune response; and (ii) administering at least one booster dose
CC   comprising a peptide including the antigen, in an adjuvant, in a combined
CC   amount effective to enhance the initial immune response; or
CC   (B) reducing an immune response as defined for (A) but using a
CC   non-adjuvant with the peptide which includes the antigen, in an amount
CC   effective to reduce the initial immune response. Method (A) is used to
CC   enhance the immune response against tumour cells expressing tumour
CC   rejection antigens, and against pathogens in subjects having human
CC   leukocyte antigen-presenting molecules. Method (B) is used to reduce the
CC   immune response in allergy, autoimmune disease, and allograft rejection.
CC   Method (A) provides an immunisation method which, unlike prior art, is
CC   not limited by the host immune response against viral vectors.

PT   Inducing a cytotoxic T lymphocyte response - by maintaining a level
PT   of antigen in the lymphatic system of a mammal so as to provide a
PT   sustained CTL response, used to treat, e.g. AIDS
PS   Disclosure; Page 40; 199pp; English.
CC   The present invention describes a method of inducing and/or sustaining
CC   an immunological cytotoxic T lymphocyte (CTL) response in a mammal. The
CC   method comprises: (a) delivering an antigen to the mammal at a level to
CC   induce an immunological CTL response in the mammal; and (b) maintaining
CC   the level of the antigen in the mammal's lymphatic system to maintain
CC   the immunologic CTL response. The method can be used for the delivery of
CC   e.g. a differentiation antigen, a tumour-specific multilineage antigen,
CC   an embryonic antigen, an oncogene antigen, a mutated tumour-suppressor
CC   gene antigen, or a viral antigen. They can be used for the treatment of
CC   disease such as cancer, e.g. malignant melanoma or infectious disease,
CC   e.g. viral disease such as hepatitis or AIDS. Sustained antigen delivery
CC   to the lymphatic system provides for potent CTL stimulation that takes
CC   place in the milieu of the lymphoid organ, and it sustains stimulation
CC   that is necessary to keep CTL active, cytotoxic and recirculating
CC   through the body. Y10071 to Y10639 represent examples of peptide
CC   antigens given in the present invention.

PT   Increasing uptake and presentation of antigen(s) - by adding mannose
PT   residue(s) to antigen for increasing T cell response, useful in,
PT   e.g. vaccines against viral infection(s)
PS   Disclosure; Page 24; 47pp; English.
CC   The peptides W54559-W54809 are examples of peptides to which at least 1
CC   (preferably 2) mannose can be attached to increase their uptake as
CC   antigens by antigen-presenting cells.  Uptake of agonist mannosylated
CC   peptides will increase the T cell response, whereas uptake of antagonist
CC   peptides blocks the T cell response.  Blocking binding of immunogenic
CC   autoantigens can be used in treatment of type I diabetes, rheumatoid
CC   arthritis, graft rejection etc., also to induce T-cell non-
CC   responsiveness.  Vaccines containing mannosylated antigen are used to
CC   prevent or treat infections by, e.g. bacteria, viruses, fungi, helminths
CC   and parasites.

PT   T cell receptor alpha and/or beta chains, and related nucleic acids
PT   - useful in pharmaceutical compsns. to prevent or treat cancer,
PT   partic. lung, melanoma, ovarian, colon, brain or kidney tumours
PS   Example 3; Page 11; 125pp; English
CC   W07378-W07381 are MART-1 epitopes, M9-1, M9-2, M10-3 and M10-4
CC   respectively, that are recognised by melanoma specific T lymphocyte
CC   receptors (TCRs). Melanoma-specific TCRs comprising an alpha and
CC   beta chain were made. Nucleic acids from either of these chains can be
CC   used as probes for the detection of expression of rearranged genes
CC   encoding tumour-associated antigens. The nucleic acids may also be used
CC   to create transgenic animals, useful as biological models to study cancer
CC   and evaluate diagnostic and therapeutic methods for the treatment of
CC   cancers, particularly melanomas. Antibodies (Abs) may be raised against
CC   alpha and beta chain polypeptides and used to detect native or denatured
CC   TCRs and/or alterations in expression levels of T cells carrying
CC   melanoma-specific TCRs. Abs can also purify and enrich T cells carrying
CC   the above receptors, which can then be administered therapeutically to
CC   mammals. Anti-idiotype antibodies can be used to assess the level of a
CC   specific T cell carrying these receptors in a mammal being treated using
CC   these methods. Host cells and vectors carrying nucleic acid encoding
CC   a TCR (or individual alpha or beta chain fragment) are useful in
CC   pharmaceutical compositions to prevent or treat cancer in a mammal, e.g.
CC   lung, melanoma, ovarian, colon, brain or kidney tumours.

PT   Disease specific immunogen  - comprises disease specific cytotoxic T
PT   lymphocyte epitope used to elicit melanoma specific CTL response
PS   Disclosure; Page 27; 93pp; English.
CC   The peptide epitope W77119-W77138 were created for human tumour-specific
CC   cytotoxic T lymphocyte response.  These peptides are are cysteine-
CC   depleted mutants of a native disease-specific CTL epitope.  The cysteine-
CC   depleted CTL epitopes elicit a stronger or more specific CTL response
CC   than the native epitope.  The epitopes can be used in a disease-specific
CC   immunogen to protect a mammal against disease in particular melanomas.
CC   The peptides may also be used to screen a sample for the presence of
CC   an antigen with the same epitope, or with a different cross-reactive
CC   epitope.

MPsrch_pp protein - protein database search, using Smith-Waterman algorithm

Run on: Fri May 5 21:59:32 2000; MasPar time 4.97 Seconds
85.483 Million cell updates/sec

Tabular output not generated.

Title: >US-09-267-439-4
Description: (1-9) from US09267439.pep
Perfect Score: 56
Sequence: 1 AAGIGILTV 9

Scoring table: PAM 150
Gap 15

Searched: 142080 seqs, 47172406 residues

Post-processing: Minimum Match 0%
Listing first 45 summaries

Database: pir62
1:pir1 2:pir2 3:pir3 4:pir4

Statistics: Mean 22.221; Variance 25.904; scale 0.858

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

MPsrch_pp protein - protein database search, using Smith-Waterman algorithm

Run on: Fri May 5 21:46:46 2000; MasPar time 6.10 Seconds
577.758 Million cell updates/sec

Tabular output not generated.

Title: >US-09-267-439-2
Description: (1-118) from US09267439.pep
Perfect Score: 889
Sequence: 1 MPREDAHFIYGYPKKGHGHS.....NAPPAYEKLSAEQSPPPYSP 118

Scoring table: PAM 150
Gap 11

Searched: 82229 seqs, 29864866 residues

Post-processing: Minimum Match 0%
Listing first 45 summaries

Database: swiss-prot38
1:swissprot

Statistics: Mean 41.234; Variance 64.540; scale 0.639

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

CC   -!- CATALYTIC ACTIVITY: L-DOPACHROME = 5,6-DIHYDROXYINDOLE-2-
CC       CARBOXYLATE.
CC   -!- COFACTOR: BINDS TWO ZINC IONS.
CC   -!- PATHWAY: MELANIN BIOSYNTHESIS.
CC   -!- SUBUNIT: TYROSINASE, TRP-1 AND TRP-2 MAY FORM A MULTIENZYME
CC       COMPLEX.
CC   -!- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN. MELANOSOMAL.
CC   -!- TISSUE SPECIFICITY: MELANOCYTES AND RETINAL PIGMENTED EPITHELIUM.
CC   -!- DISEASE: THE SLATY MUTATION IN TYRP2 LEADS TO A DECREASE OF DT
CC       ACTIVITY AND A CONSEQUENT CHANGE IN THE PIGMENTATION OF THE MICE
CC       TO A DARK GREY/BROWN EUMELANIN. THE SLATY-2J MUTATION HAS A
CC       SIMILAR PHENOTYPE, THE SLATY-LT (LIGHT) MUTATION HAS A MORE SEVERE
CC       EFFECT AND IS SEMIDOMINANT, ITS PHENOTYPE MAY BE A RESULT OF THE
CC       FAILURE OF THE ENZYME TO BE CORRECTLY TARGETED TO ITS NORMAL
CC       LOCATION ON THE INNER FACE OF THE MELANOSOMAL MEMBRANE.
CC   -!- SIMILARITY: BELONGS TO THE TYROSINASE FAMILY.

CC   -!- SUBUNIT: HETEROTETRAMER OF TWO ALPHA AND TWO BETA SUBUNITS WHICH
CC       IS FORMED BY THE NON-COVALENT ASSOCIATION OF TWO DISULFIDE-LINKED
CC       HETERODIMERS.
CC   -!- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
CC   -!- TISSUE SPECIFICITY: KIDNEY, INTESTINAL BRUSH BORDERS, AND
CC       SALIVARY DUCTS.
CC   -!- SIMILARITY: BELONGS TO PEPTIDASE FAMILY M12A (ZINC
CC       METALLOPROTEASE); ALSO KNOWN AS THE ASTACIN SUBFAMILY.
CC   -!- SIMILARITY: CONTAINS 1 MAM DOMAIN.
```

RL   Submitted (MAY-1996) to the EMBL/GenBank/DDBJ databases.
CC   -!- FUNCTION: THE PLASMA MEMBRANE ATPASE OF PLANTS AND FUNGI IS A
CC       HYDROGEN ION PUMP. THE PROTON GRADIENT IT GENERATES DRIVES THE
CC       ACTIVE TRANSPORT OF NUTRIENTS BY H+-SYMPORT. THE RESULTING
CC       EXTERNAL ACIDIFICATION AND/OR INTERNAL ALKINIZATION MAY MEDIATE
CC       GROWTH RESPONSES.
CC   -!- CATALYTIC ACTIVITY: ATP + H(2)O = ADP + ORTHOPHOSPHATE.
CC   -!- SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.
CC   -!- PTM: PHOSPHORYLATED ON MULTIPLE SER AND THR RESIDUES.
CC   -!- MISCELLANEOUS: THERE ARE TWO PLASMA MEMBRANE ATPASES IN YEAST.
CC       THIS IS THE MAJOR ISOFORM.
CC   -!- SIMILARITY: BELONGS TO THE CATION TRANSPORT ATPASES FAMILY
CC       (E1-E2 ATPASES).

PT   Secreted human polypeptides - having cytokine, cell proliferation or
PT   differentiation, activin or inhibin, tumour inhibition or
PT   anti-inflammatory activities
PS   Claim 1; Pages 49-50; 78pp; English.
CC   This represents a human secreted protein. The specification provides
CC   secreted protein sequences (W63681 to W63699) encoded by the nucleic
CC   acid sequences shown in V43601 to V43619. The invention provides a
CC   method of identifying a secreted polypeptide which is modified by rough
CC   microsomes. The secreted proteins can be used in assays to determine
CC   biological activities, such as cytokine, cell proliferation, or cellular
CC   differentiation activities, tissue growth or regeneration, activin or
CC   inhibin activity, chemotactic or chemokinetic activity, haemostatic or
CC   thrombolytic activity, receptor/ligand activity, tumour inhibition, or
CC   anti-inflammatory activity. The proteins can also be used as biomarkers,
CC   to identify tissues or cell types which express the proteins, or a stage-
CC   or disease-specific alteration in protein expression. They can be used
CC   in protein interaction assays, to identify ligands or binding proteins.
CC   Compounds which affect the biological activities of the secreted proteins
CC   or their ability to interact with specific ligands can be identified
CC   using the proteins in screening assays. The proteins and antibodies that
CC   bind specifically to the protein can also be used to design diagnostic
CC   tests and therapeutic compositions for diseases which may be associated
CC   with altered expression of these proteins. Fusion proteins comprising,
CC   e.g. signal sequences or transmembrane domains of the proteins can be
CC   used to target other protein domains to cellular membrane or they can
CC   be secreted extracellularly.

PT   Compsn. contg. plasminogen activator conjugated to heparin component -
PT   used for treatment of thromboembolic disease, with longer half
PT   life and improved targeting.
PS   Disclosure; p; English.
CC   Gene encodes hybrid plasminogen activator (PA) comprising Kringle 1, an
CC   urokinase linker, and an urokinase protease domain wherin glycine residue
CC   at position 158 is replaced with a lysine.
CC   The compound is used to treat thromboembolic disease esp. with myocardial
CC   infarction, has a longer half-life than free PA and targets the heparin
CC   site of thrombus or embolism reducing the risk of reocclusion.

PT   Helicobacter pylori nucleic acid sequences and related
PT   polypeptide(s)  - useful for vaccines to treat or prevent H. pylori
PT   infection, and to detect Helicobacter
PS   Claim 56; Page 1322; 1481pp; English.
CC   The present sequence is a H. pylori cell envelope protein.
CC   The protein may be used in a vaccine to prevent or treat H. pylori
CC   infection or to identify H. pylori polypeptide binding compounds,
CC   useful as potential H. pylori life cycle activators or inhibitors.
CC   The genomic sequence of H. pylori (ATCC 55679) was determined from
CC   overlapping contigs generated by mechanically shearing the bacterial
CC   DNA. The sequences were analysed for ORF of at least 180 nucleotides,
CC   and the predicted coding regions defined by computer evaluation. To
CC   identify likely H. pylori antigens for vaccine development, the amino
CC   acid sequences predicted from various ORF were analysed for significant
CC   homology to other known or exported membrane proteins. Having identified
CC   and determined the sequences of interest, particular regions can be
CC   isolated from H. pylori by PCR amplification for recombinant polypeptide
CC   production, e.g. in E. coli hosts.

PT   Helicobacter pylori nucleic acids and proteins - used to develop
PT   products for the detection, prevention and treatment of H. pylori
PT   infections
PS   Claims 27, 31; Page 217; 279pp; English.
CC   Recombinant or substantially pure preparations of H. pylori polypeptides
CC   are disclosed, together with the nucleic acids encoding them. In all,
CC   73 ORFs are shown. The proteins are variously cell envelope proteins,
CC   secreted proteins or other cellular proteins. Vaccines containing the
CC   nucleic acids or proteins are claimed, as are probes containing at least
CC   8 nucleotides from the nucleic acid sequences. The vaccines are useful
CC   for treating or reducing the risk of H. pylori infections, and the
CC   probes can be used diagnostically for detecting the presence of
CC   Helicobacter in a sample. The products are also of use in screening
CC   for compounds having the ability to interfere with the H. pylori life
CC   cycle or to inhibit H. pylori infection.

PT   Cancer antigen peptide(s) derived from the tyrosinase-related
PT   protein 1 or 2  - useful for detecting, preventing or treating a
PT   cancer in a mammal, especially melanoma
PS   Claim 12; Pages 81-83; 111pp; English.
CC   The present sequence represents the novel tyrosinase related
CC   protein 2 (TRP-2). This protein contains tumour antigens recognised
CC   by tumour infiltrating lymphocyte (TIL) 586. Novel cancer peptides have
CC   also been identified in TRP-1. The peptides are recognised by a major
CC   histocompatibility complex (MHC) class I T-lymphocyte. The nucleic acids
CC   encoding the cancer peptides or TRP-2 can be used to detect a cancer or
CC   pre-cancer in a mammal, especially by detecting the presence of the
CC   alterative ORF 3 of the TRP-1 gene or the sequence encoding the novel
CC   tumour antigen TRP-2. Vectors and recombinant viruses containing
CC   antigen peptide encoding nucleic acids, antibodies raised against the
CC   peptides, or the peptides themselves can be used to prevent or treat
CC   a cancer in a mammal, especially a melanoma.

CC   B7-1 (R82900) has the signal peptide directly linked to the
CC   IgC-like domain, i.e. the IgV-like domain is deleted.  It is
CC   encoded by exons 1, 3, 4 and 5 (see T01047) of the B7-1 gene.  An
CC   alternatively spliced form of IgV-deleted B7-1 (R82901) is encoded
CC   by exons 1, 3, 4 and 6.  T-cell costimulatory molecules can be
CC   produced in which the IgV-like domain is deleted.

PT   Novel T cell co-stimulatory molecules - corresponding to naturally
PT   occurring alternatively spliced forms of T cells co-stimulatory
PT   molecules or variants
PS   Disclosure; Page 91-92; 111pp; English.
CC   A naturally occurring form of mouse T-cell costimulatory molecule
CC   B7-1 (R82902) has the IgV-like domain directly linked to the
CC   transmembrane domain, i.e. the IgC-like domain is deleted. It is
CC   encoded by exons 1, 2, 4 and 5 of the B7-1 (T01049) gene.
CC   This IgV-like isoform of B701 was expressed in CHO cells. It
CC   triggered a costimulatory signal in T-cells, causing stimulation
CC   of interleukin-2 prodn.

PT   Nucleic acids encoding CTLA4/CD28 counter receptor, B7-2 - useful
PT   for enhancing or suppressing T-cell mediated immune responses
PS   Disclosure; pages 118-120; 175pp; English.
CC   Q81371 is in pCDM8 vector. It is derived from germline B
CC   lymphocytes, cell lines 70Z and A20, clones B7 nos. 1 and 29.
CC   It can be found in Genbank at Accession no. X60958. The encoded
CC   protein, R67990, binds both human CTLA4 and human CD28. It is
CC   related to human hB7-2 (see Q81351) and human hB7-1 (see Q81371).
CC   Part of R67990 (see CC) is published in Freeman, G.J. et al.
CC   J. of Experimental Medicine, in press at the time when the patent
CC   application was written.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

RL   Cell Motil. Cytoskeleton 40:71-86(1998).
CC   -!- FUNCTION: THIS PROTEIN IS ESSENTIAL TO THE CELL-DIVISION PROCESS.
CC       ITS SEEMS TO ASSEMBLE INTO A DYNAMIC RING ON THE INNER SURFACE OF
CC       THE CYTOPLASMIC MEMBRANE AT THE PLACE WHERE DIVISION WILL OCCUR,
CC       AND THE FORMATION OF THE RING IS THE SIGNAL FOR SEPTATION TO
CC       BEGIN. BINDS TO AND HYDROLYZES GTP.
CC   -!- SUBUNIT: AGGREGATE TO FORM A RING-LIKE STRUCTURE.
CC   -!- SUBCELLULAR LOCATION: CYTOPLASMIC. ASSEMBLE AT THE INNER SURFACE
CC       OF THE CYTOPLASMIC MEMBRANE (BY SIMILARITY).
CC   -!- SIMILARITY: BELONGS TO THE FTSZ FAMILY.
CC   ---------------------------------------------------------------------------
